

Who Does What & How

A complete role-by-role breakdown of every person in the system — their account, their app, their screens, and every action they take.

ACCOUNT CREATION CHAIN — WHO CREATES WHO

Role	Created by	App / Portal	Can access
Super Admin	Manually seeded at launch	medilink.com/super-admin	Full platform management
Clinic Admin	Super Admin (email invite)	medilink.com/clinic	Own clinic only
Doctor	Clinic Admin (email invite)	medilink.com/clinic	Own schedule + patients
Technician	Clinic Admin (email invite)	medilink.com/clinic	Lab results upload only
Patient	Self-registered (public sign-up)	medilink.com + mobile app	Book, pay, view own records

Super Admin — MediLink company staff

WHO EXACTLY

1–2 people inside your company who run the platform

APP THEY USE

medilink.com/super-admin (web only, not public)

ACCOUNT CREATED BY

Manually seeded in the database at launch

DAY-TO-DAY JOURNEY

1 Log in to the super admin panel

Goes to medilink.com/super-admin. Enters email + password. Because this role is so powerful, 2FA (Google Authenticator) is mandatory — the system refuses entry without the 6-digit code. The middleware also checks the IP address against an allowlist.

Screen: Login + 2FA verify

2 A new clinic wants to join the platform

A clinic contacts MediLink outside the app (phone, email, form). Once agreed, the super admin opens the Clinic Management section and creates a new clinic record.

- Fills in: clinic name, location, type (clinic / hospital / lab / radiology / physio / skincare)
- Sets how many admin accounts this clinic is allowed to have (e.g. 1 for a small clinic, 3 for a multi-branch hospital)
- Sets which optional permissions the clinic admin will have (billing access, edit clinic profile, etc.)

Screen: Create clinic form

System: Inserts a row into the facilities table. The clinic now exists in the database but has no staff and is not yet visible to patients.

3 Create the Clinic Admin account

Still inside the same flow, the super admin enters the details of the person who will manage that clinic.

- Full name, email address, phone number
- Clicks 'Send Invitation' — system creates an unactivated account and emails an activation link
- The link expires after 48 hours. Super admin can resend from the panel if needed

Screen: Create clinic admin form

System: Calls Supabase Auth invite API → creates auth.users row with role=clinic_admin + facility_id → sends activation email automatically.

4 Ongoing: monitor and manage the platform

Once clinics are live, the super admin's job is platform health — not day-to-day clinic operations.

- Platform analytics: total bookings across all clinics, revenue, active users
- Suspend or unsuspend a clinic (non-payment or policy violation)
- Review flagged patient reviews that clinic admins have escalated
- View the full audit log — every sensitive action is timestamped and immutably recorded
- Manage system config: SMS templates, AI prompts, payment fee percentages

Screen: Platform dashboard

Screen: Audit logs

Screen: Clinic management

Clinic Admin — the clinic's operations manager

WHO EXACTLY

The clinic manager or front-desk supervisor hired by the clinic

APP THEY USE

medilink.com/clinic (facility dashboard, web only)

ACCOUNT CREATED BY

Super Admin sends them an email invite

FIRST TIME — ACCOUNT ACTIVATION

1 Receives activation email

Gets an email: 'You've been added as admin of [Clinic Name] on MediLink. Click to activate your account.' Clicks the link, lands on a page to set their password. After setting password, they're immediately logged into the facility dashboard. Their account is already linked to their clinic — they can only ever see their own clinic's data.

Screen: Set password

Screen: Facility dashboard home

2 Complete the clinic's public profile

Patients will see this profile when they find the clinic on the patient app. The clinic is not discoverable until this is done.

- Upload clinic logo and cover photo
- Enter address — a map pin preview appears so they can verify the location
- Set working hours (e.g. Sat–Thu 8am–8pm, Fri closed)
- Select services offered (general consultation, lab, radiology, physio, etc.)
- Upload gallery photos and enter accepted insurance providers

Screen: Clinic profile editor

3 Onboard doctors (one by one)

For each doctor who will work at the clinic, the clinic admin fills a 5-step form:

- Step 1 — Basic info: first name, last name, email, phone, gender, optional short bio
- Step 2 — Credentials: medical specialty, license number, license expiry date, qualifications. Upload license scan and certificates.
- Step 3 — Availability: which days they work, start and end time each day, consultation duration (e.g. 20-min slots), consultation fee in OMR
- Step 4 — Services: tick which services this doctor provides (general consult, follow-up, vaccination, minor surgery, telemedicine, etc.)
- Step 5 — Review and confirm: previews everything, clicks 'Onboard Doctor' — system sends activation email to the doctor

Screen: Add doctor (5-step form)

System: Creates doctor account in Supabase Auth with role=doctor + facility_id. Creates doctor profile row with all availability and fee data. Sends invite email to doctor.

4 Onboard technicians (same flow, simpler)

Same invite flow as doctors but collects less — just name, email, and role type (lab technician, radiology technician). No schedule or fees needed since technicians don't take appointments directly.

Screen: Add technician form

5 Morning: check today's appointments

Opens the team calendar — a multi-column view where each column is one doctor, and each block is a booked appointment. Can see who is confirmed, who has checked in, and who hasn't shown up. Can drag and drop to reassign slots.

Screen: Team calendar (day view)

6 During the day: manage the queue

The reception screen shows a live queue of patients who have checked in. New check-ins appear automatically — no page refresh needed.

- Click 'Call next' to summon the next patient
- Add a walk-in patient: enter name and phone, system creates a temporary appointment and adds them to the queue
- Approve or reject emergency visit requests that patients submit from the mobile app
- Mark patients as 'done' to clear them from the queue

Screen: Live queue / reception

7 Manage reviews and announcements

Sees all patient reviews left for the clinic and its doctors. Can reply publicly. Can flag inappropriate reviews to escalate to super admin. Can send broadcast announcements to all clinic patients (e.g. 'We are closed on Friday' or 'New dermatologist now available').

Screen: Reviews panel

Screen: Announcements

8 View reports and earnings

End of day or week: checks the earnings dashboard (revenue by period, per-doctor breakdown, payment method split), analytics (busiest hours, most booked doctors, patient demographics, no-show rate), and downloads PDF reports.

Screen: Earnings dashboard

Screen: Analytics

Doctor — licensed physician at the clinic

WHO EXACTLY

Any physician employed by or contracted to the clinic

APP THEY USE

medilink.com/clinic — same dashboard, different view to clinic admin

ACCOUNT CREATED BY

Clinic Admin — doctor receives an email invite

FIRST TIME — ACTIVATION

1 Receives activation email from clinic

Email says: 'You've been added as a doctor at [Clinic Name] on MediLink.' Clicks link, sets password, lands on their personal doctor dashboard. Their schedule, fees, and services are already filled in — the clinic admin set those up. They review and can request changes.

Screen: Doctor dashboard home

EVERY DAY

2 Set their status at the start of the day

Toggles their live status to 'Available'. Patients on the patient app see a green dot on this doctor's profile card in real time. Throughout the day they switch between: Available → With Patient → On Break → Unavailable. If the status isn't updated for 15 minutes, the system auto-sets it to Unavailable.

Screen: Status toggle (top of dashboard)

3 Before each appointment: review patient details

Clicks an appointment block to open the patient detail panel — a side panel showing everything before the patient walks in:

- Patient name, age, gender, blood group
- Medical history: allergies, chronic conditions, current medications, past surgeries
- Pre-consultation form: what the patient wrote about their chief complaint and symptoms
- Documents the patient uploaded to their vault (previous prescriptions, reports, imaging)
- Past appointment notes from previous visits at this clinic

Screen: Appointment detail panel

4 For video appointments: join the call

If the appointment type is 'online', a 'Join Call' button appears 5 minutes before the slot. Clicking it opens the Daily.co video room in the browser. The patient medical history panel stays visible alongside the video window. After the call ends, the doctor adds notes immediately.

Screen: Video call + patient panel side by side

5 After each appointment: write notes and issue prescription

Once the patient leaves (or the video call ends), the doctor fills in:

- Clinical notes: diagnosis, findings, treatment plan. The AI then generates a plain-English summary to show the patient.
- Digital prescription: medications, dosages, frequency, and instructions. Generates a PDF automatically. Patient receives it in their app and can share a 24-hour link with any pharmacy.
- Lab request (if needed): orders a test — creates a task for the technician to upload results when ready.

Screen: Add notes form

Screen: Write prescription

6 Message patients post-visit

For 7 days after a confirmed appointment, the doctor and patient can exchange secure messages inside the app — linked to that appointment. After 7 days, the conversation closes automatically. Useful for 'is the medication working?' follow-ups without booking a new appointment.

Screen: Secure messaging thread

Technician — lab or radiology staff

WHO EXACTLY

Lab technician, radiology tech, phlebotomist — anyone who processes tests

APP THEY USE

medilink.com/clinic — same dashboard, very restricted view

ACCOUNT CREATED BY

Clinic Admin — same email invite flow as doctors

WHAT THEY SEE AND DO

1 Activation — same as doctor

Receives email invite from clinic admin, clicks link, sets password. Logs into the facility dashboard. Immediately notices the dashboard is much simpler than the doctor or clinic admin view — Supabase RLS policies restrict everything else.

2 View pending lab requests

Sees a list of lab requests that doctors have ordered for patients. Each row shows: patient name, test name, ordering doctor, appointment date, and status (pending → processing → uploaded).

Screen: Lab requests list

3 Upload the result

Opens a pending request, uploads the result file (PDF or image — max 10MB). Adds the test name, any clinical notes, and clicks 'Deliver to patient'.

System: File goes to Supabase Storage. A database trigger immediately fires — sends push notification + SMS to the patient: 'Your lab results are ready.' Result appears in patient's Document Vault with an unread badge.

Screen: Upload result form

4 That's it — no other access

Technicians cannot see appointment notes, financial data, other patients' records, or any clinic management screens. RLS policies at the database level make this impossible — it's not just a hidden button, the data literally doesn't return in their queries.

Patient — end user of the platform

WHO EXACTLY

Anyone who wants to book a healthcare appointment in Oman

APP THEY USE

medilink.com (web) or MediLink mobile app — both fully public

ACCOUNT CREATED BY

Themselves — fully self-service, no invite needed

FIRST TIME — REGISTRATION

1 Sign up

Opens the app or website. Taps 'Create account'. Three options: email + password, Sign in with Google, or Sign in with Apple. After signing up, must verify their phone number — system sends a 6-digit OTP via SMS. Without verification, they cannot book appointments.

Screen: Sign up

Screen: Phone verification (OTP)

2 Build their profile

Fills in: profile photo, date of birth, gender, blood group, home address, emergency contact. Can optionally fill in medical history (allergies, chronic conditions, current medications) — this shows doctors automatically during appointments. Can add up to 5 family members to book on their behalf.

Screen: Profile setup

Screen: Medical history form

Screen: Add family member

BOOKING AN APPOINTMENT

3 Find a doctor — three ways

- Search directly: type a specialty or doctor name, filter by location, clinic type, distance, availability, fee range
- AI symptom input: describe symptoms in plain English — AI returns the relevant specialty and available doctors
- From favourites or history: tap a saved doctor or re-book from a previous appointment card

Screen: Search / Explore

Screen: AI symptom checker

Screen: Doctor profile

4 Pick a slot and confirm

Taps a doctor's profile, sees their weekly availability as a slot picker calendar. Picks a date and time. Selects who the appointment is for (themselves or a family member). Selects appointment type (in-person or video). Reviews summary — doctor name, clinic, date, fee, type.

Screen: Slot picker

Screen: Booking review

System: Runs an atomic database check to prevent double-booking. If the slot was just taken by someone else, shows 'Slot no longer available — here are alternatives.' Otherwise reserves it immediately.

5 Pay

Taps 'Confirm and Pay'. Redirected to Thawani or Ompay checkout. Pays by card. Returns to app. System only confirms the appointment after the payment webhook is received — the app never trusts the redirect alone. Gets confirmation via SMS, email, and WhatsApp simultaneously. A PDF invoice is generated and emailed.

Screen: Payment gateway (external)

Screen: Booking confirmed

DAY OF APPOINTMENT

6 Check in

30 minutes before the slot, a 'Check In' button appears on the appointment card. Tapping it notifies the clinic and adds the patient to the live queue. For video appointments: the same button opens a virtual waiting room showing their queue position and estimated wait time. When the doctor is ready, the app automatically navigates them into the video call.

Screen: Appointment card with Check In

Screen: Virtual waiting room

AFTER THE APPOINTMENT

7 Receives visit summary, prescription, and results

- Push notification: 'Your visit summary is ready' — plain-English AI summary of the doctor's clinical notes, what was prescribed, and when to seek urgent care
- Prescription PDF available in app — can download or share a 24-hour link with a pharmacy
- If labs were ordered: notification when technician uploads results, PDF appears in Document Vault
- Can message the doctor securely for 7 days via in-app chat
- Prompted to leave a star rating and review for the doctor and clinic

Screen: Visit summary

Screen: Document vault

Screen: Leave review
